

UML Class Diagrams Notes

Sequence:

- First one I identified for the assignment, because it is crucial to get a user sequence and a randomly generated sequence of ints
- It shouldn't have any operations, as it just holds the fields

Log:

- The log has 2 sequences so this is an example of decomposition.
- It basically does what it says for class name: a log of a game, so what user sequence and generated sequence was, the time and if the user got the right answer

Summary

- The summary has 0 or more logs, and it is more general overall than logs class. The log class is about a certain game, but summary is across the overall games played and how much they got correct and total accuracy.

GamePlayState

- I had to break it up from the GameplayScreen bc I ended up mixing UI with Logic too much, so this just gets all the current states/variables during game play.

GamePlayController

- The game play state above was purely just holding state of the variables, this class however had "control" over how game worked. So it had functions inside of it to outline general things game should be doing

Colors

- I know Kotlin already has a Color class, but this one was more so for my theme colors of the app. I just wanted to put it into this class so it's more accessible and controlled
